As a one-chip solution which complies with Universal Serial Bus specification rev. 2.0 and ATA / ATAPI-6 specification rev 1.0, the GL811E can support various kinds of ATA / ATAPI device. There are totally 4 endpoints in the GL811E controller, Control (0), Bulk In (1), Bulk Out (2), and Interrupt (3). By complies with the USB Storage Class specification ver.1.0 (Bulk only protocol), the GL811E can support not only plug and play but also Windows XP/ 2000/ ME default driver.

The GL811E uses 12MHz crystal and slew-rate controlled pads to reduce the EMI issue. ## CHAPTER 4 BLOCK DIAGRAM

**Figure 4.1 - Block Diagram**

## CHAPTER 5 FUNCTION DESCRIPTION

### 1. USB 2.0 TXCVR

The USB 2.0 Transceiver is the analog circuitry to handle the USB HS/FS signaling.

### 2. UTMI (USB 2.0 Transceiver Macrocell Interface) Logic

The UTMI Logic is compliant to Intel's UTMI specification 1.01. This block handles the low level USB protocol and signaling. The major jobs of UTMI Logic is data and clock recovery, NRZI encoding/decoding, Bit Stuffing/De-stuffing, USB2.0 test modes supporting and serial / parallel conversion.

### 3. SIE (Serial Interface Engine)

The SIE contains the USB packet ID and address recognition logic, and other sequencing and state machine logic to handle USB packets and transactions.

### 4. PLL

10XPLL provides the 120MHz clock output for UTMI Logic block. UTMI operates in 120MHz for USB HS data processing. 40XPLL block will provide 480MHz for USB HS data transmission.

### 5. CLKGEN

CLKGEN is the clock generator block for the logic blocks. It generates 15MHz clock for micro controller, 48MHz for MDMA mode, 96MHz for UDMA mode, and 30MHz clock for UTMI, SIE, and FIFO.

### 6. CPU

The CPU is the control center of GL811E. It's an 8-bit micro controller operating in 15MHz, 7.5 MIPS. After receiving a USB command, it decodes the host command, then it re-assigns tasks to the IDE engine, GPIO, FIFO, and response proper data/status to USB host.

### 7. IDE Engine

The IDE engine is extended from standard ATA / ATAPI protocol. It supports multiword DMA mode, and ultra DMA mode data transfers.

### 8. FIFOs

*Control FIFO* is used as Control Read / Write FIFO. *TXFIFO0* / *TXFIFO1* are two sets of 512-byte ping-pong FIFO for Bulk Read endpoint. It buffers data from IDE engine, and re-direct to USB SIE logic. *RXFIFO0* / *RXFIFO1* are two sets of 512-byte ping-pong FIFO for Bulk Write endpoint. It buffers data from USB SIE logic, and re-direct to IDE engine.

### 9. Control Registers

Control Register configures GL811E to proper operation. For example, CPU can set register to generate wakeup event, enter suspend, transmits proper USB packet to host.

### 10. ATA/ATAPI

The GL811E complies with ATA/ATAPI-6 specification rev. 1.0. Please refer to the specifications for more information.

### 11. USB 2.0

The GL811E complies with Universal Serial Bus specification rev. 2.0, and it integrates Genesys Logic own design UTMI transceiver that fully complies with the USB 2.0 Transceiver Macrocell Interface (UTMI) specification rev. 1.01. Please refer to the specifications for more information.

## 6.4 AC Characteristics- ATA/ ATAPI

The GL811E complies with ATA / ATAPI-6 specification rev 1.0, which supports following data transfer modes:

1. DMA (Direct Memory Access) data transfer:  
DMA data transfer means of data transfer between device and host memory without host processor intervention.
  - Multiword DMA: Multiword DMA is a data transfer protocol used with the READ DMA, WRITE DMA, READ DMA QUEUED, WRITE DMA QUEUED and PACKET commands. When a Multiword DMA transfer is enabled as indicated by IDENTIFY DEVICE or IDENTIFY PACKET DEVICE data, this data transfer protocol shall be used for the data transfers associated with these commands. (Please refer to the ATA / ATAPI-6 specification rev 1.0 for more information.)
  - Ultra DMA: Ultra DMA Is a data transfer protocol used with the READ DMA, WRITE DMA, READ DMA QUEUED, WRITE DMA QUEUED and PACKET commands. When this protocol is enabled, the Ultra DMA protocol shall be used instead of the Multiword DMA protocol when these commands are issued by the host. This protocol applies to the Ultra DMA data burst only. (Please refer to the ATA / ATAPI-6 specification rev 1.0 for more information.)

Following listed the symbols and their respective definitions that are used in the timing diagram:

/ or \	- Signal transition (asserted or negated)
< or >	- Data transition (asserted or negated)
	- Data valid
	- Undefined but not necessarily released
	- Asserted, negated or released
	- Released
	- The "other" condition if a signal is shown with no change

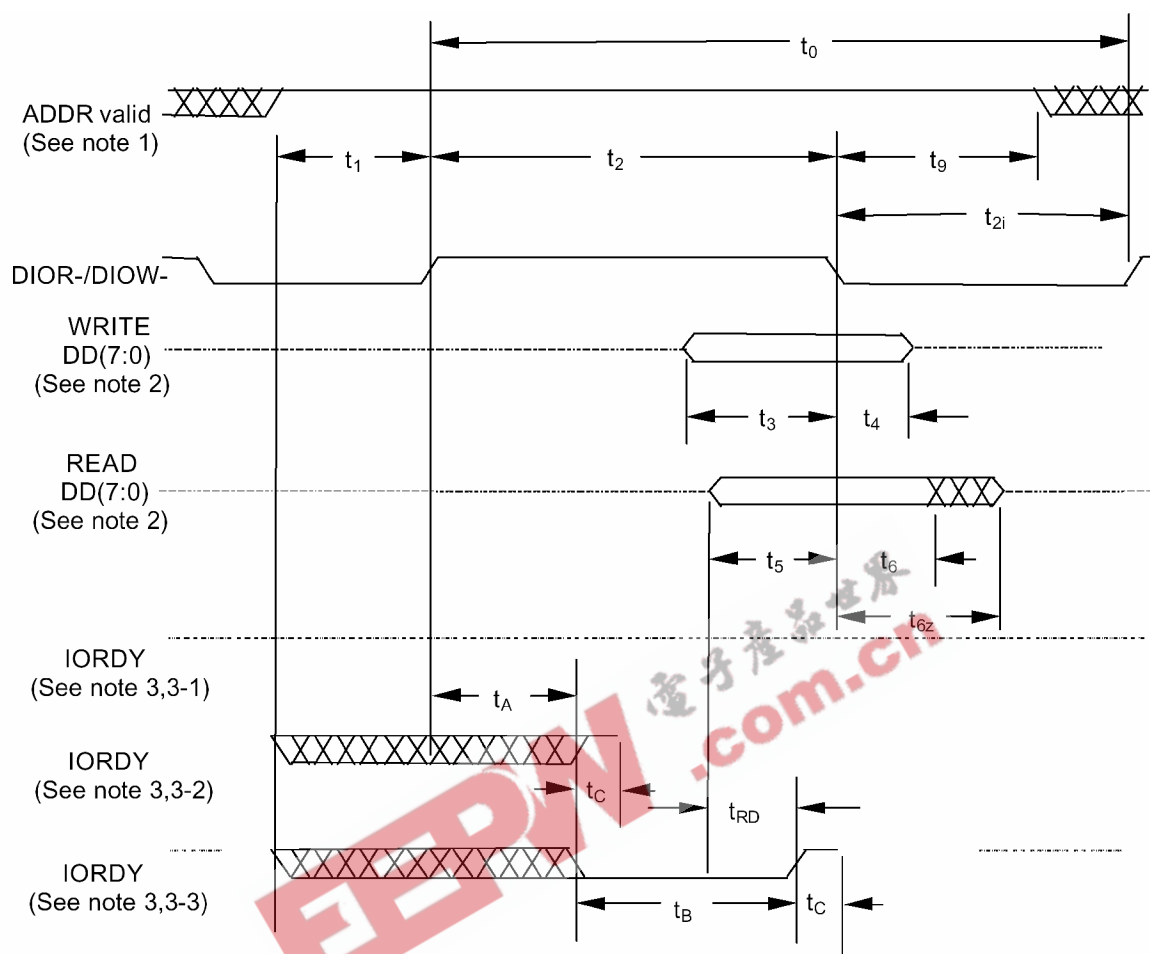

All signals are shown with the asserted condition facing to the top of the page. The negated condition is shown towards the bottom of the page relative to the asserted condition.

The interface uses a mixture of negative and positive signals for control and data. The terms asserted and negated are used for consistency and are independent of electrical characteristics.

In all timing diagrams, the lower line indicates negated, and the upper line indicates asserted. The following illustrates the representation of a signal named Test going from negated to asserted and back to negated, based on the polarity of the signal.

## 6.4.1 Register Transfers

### Notes:

1. Device address consists of signals CS0\_, CS1\_ and DA(2:0).
2. Data consists of IODD(7:0).
3. The negation of IORDY by the device is used to extend the register transfer cycle. The determination of whether the cycle is to be extended is made by the host after  $t_A$  from the assertion of DIOR\_ or DIOW\_. The assertion and negation of IORDY are described as following:
  - 3.1 Device never negates IORDY, devices keeps IORDY released: no wait is generated.
  - 3.2 Device negates IORDY before  $t_A$ , but causes IORDY to be asserted before  $t_A$ . IORDY is released prior to negation and may be asserted for no more than 5 ns before release: no wait generated.
  - 3.3 Device negates IORDY before  $t_A$ , IORDY is released prior to negation and may be asserted for no more than 5 ns before release: wait generated. The cycle completes after IORDY is released. For cycles where a wait is generated and DIOR\_ is asserted, the device shall read data on IODD(0:7) for  $t_{RD}$  before asserting IORDY.
4. DMACK\_ shall remain negated during a register transfer.

Register transfer timing parameters		Timing (ns)
$t_0$	Cycle time	2000
$t_1$	Address valid to DIOR_/ DIOW_ setup	1000
$t_2$	DIOR_/ DIOW_ pulse width 8-bit	300

$t_A$	IORDY Setup time	-
$t_B$	IORDY Pulse Width	-

#### 6.4.2 Multiword DMA data transfer

Register transfer timing parameters		Timing (ns)
$t_0$	Cycle time	120
$t_D$	DIOR_/ DIOW_ asserted pulse width	80
$t_E$	DIOR_ data access	-
$t_F$	DIOR_ data hold	-
$t_G$	DIOR_/ DIOW_ data setup	40
$t_H$	DIOW_ data hold	18
$t_I$	DMACK to DIOR_/ DIOW_ setup	18
$t_J$	DIOR_/ DIOW_ to DMACK hold	20
$t_{KR}$	DIOR_ negated pulse width	36
$t_{KW}$	DIOW_ negated pulse width	36
$t_{LR}$	DIOR_ to DMARQ delay	-
$t_{LW}$	DIOW_ to DMARQ delay	-
$t_M$	CS(1:0) (max) valid to DIOR_/ DIOW_	36
$t_N$	CS(1:0) hold	18
$t_Z$	DMACK_ to read data released	-

Note:

The host shall not assert DMACK\_ or negate both CS0\_ and CS1\_ until the assertion of DMARQ is detected. The maximum time from the assertion of DMARQ to the assertion of DMACK\_ or the negation of both CS0\_ and CS1\_ is not defined.

**Figure 6.1 - Initiating a Multiword DMA Data Burst**

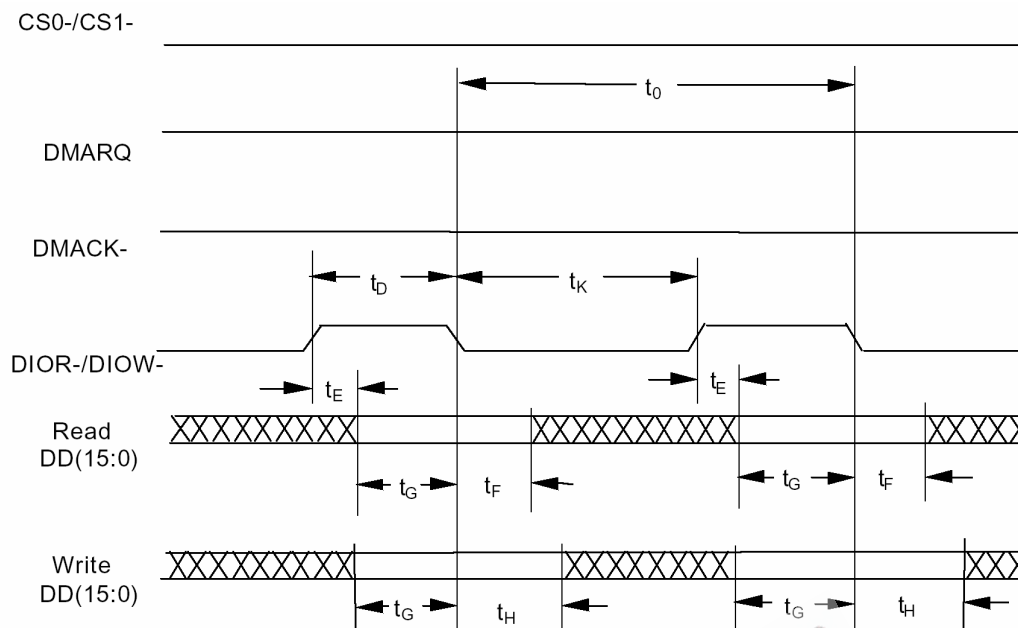

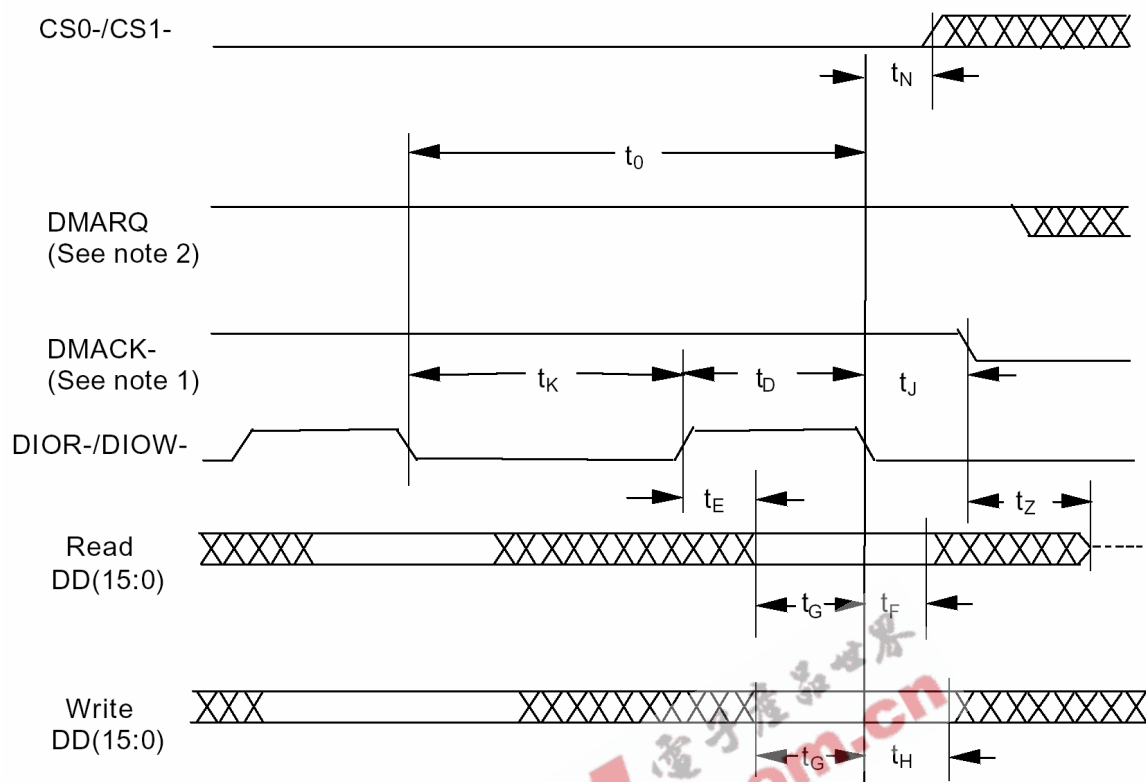

Figure 6.2 - Sustaining a Multiword DMA Data Burst

Note:

To terminate the data burst, the Device shall negate DMARQ within the  $t_L$  of the assertion of the current DIOR\_ or DIOW\_ pulse. The last data word for the burst shall then be transferred by the negation of the current DIOR\_ or DIOW\_ pulse. If all data for the command has not been transferred, the device shall reassert DMARQ again at any later time to resume the DMA operation.

Figure 6.3 - Device Terminating a Multiword DMA Data Burst

Note:

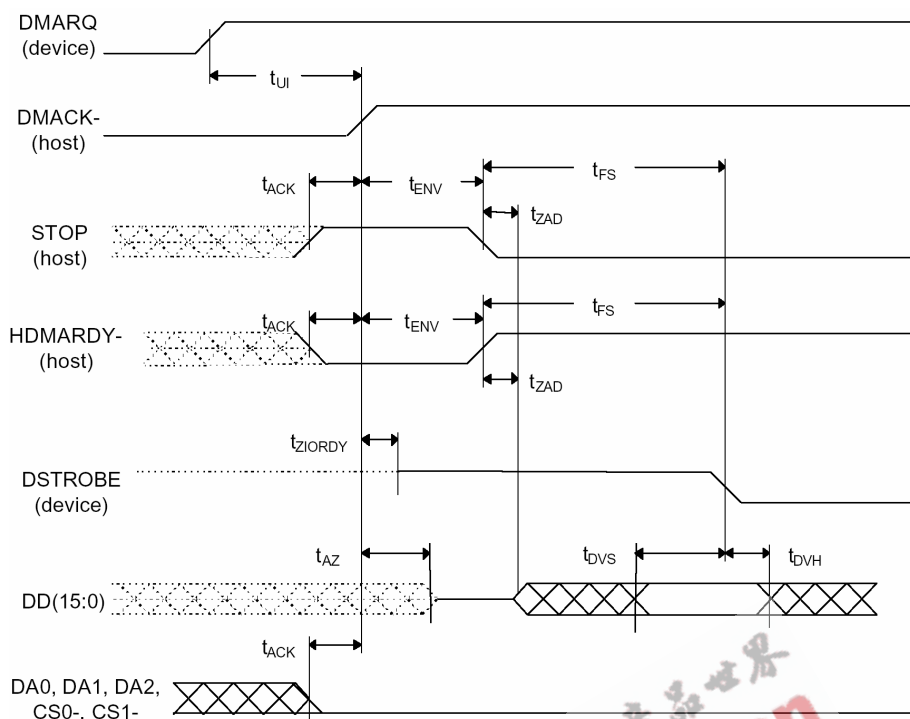

1. To terminate the transmission of a data burst, the Host shall negate DMACK\_ within the specified time after a DIOR\_ or DIOW\_ pulse. No further DIOR\_ or DIOW\_ pulses shall be asserted for this burst.
2. If the device is able to continue the transfer of data, the device may leave DMARQ asserted and wait for the host to reassert DMACK\_ or may negate DMARQ at any time after detecting that DMACK\_ has been negated.

Notes:

The definitions for the DIOW\_:STOP, DIOR\_:HDMARDY\_,HSTROBE and IORDY:DDMARDY\_:DSTROBE signal lines are not in efficient until DMARQ and DMACK are asserted.

Figure 6.5 - Initiating an Ultra DMA Data-In Burst

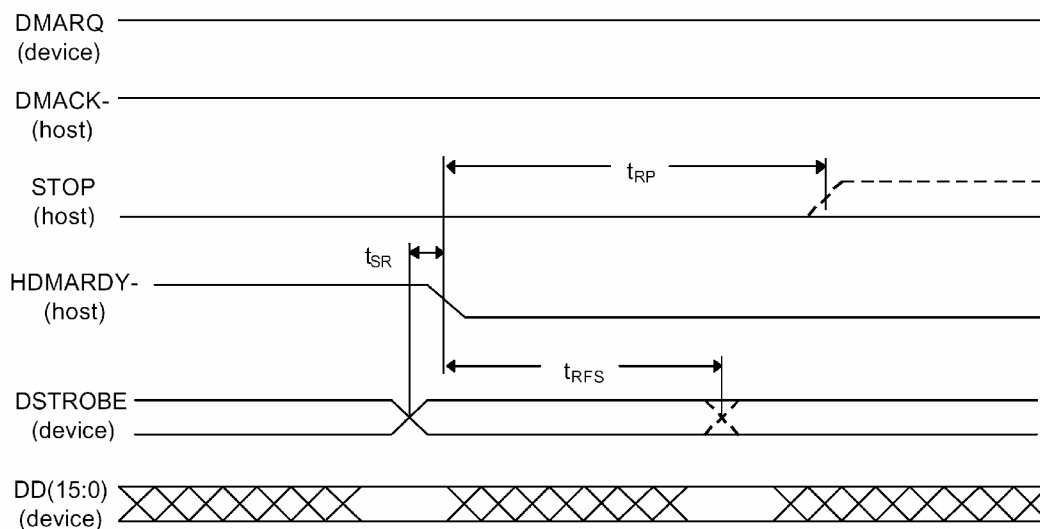

Notes:

IODD(15:0) and DSTROBE signals are shown at both the host and the device to emphasize that cable settling time as well as cable propagation delay shall not allow the data signals to be considered stable at the host until some time after they are driven by the device.

Figure 6.6 - Sustained Ultra DMA Data-In Burst

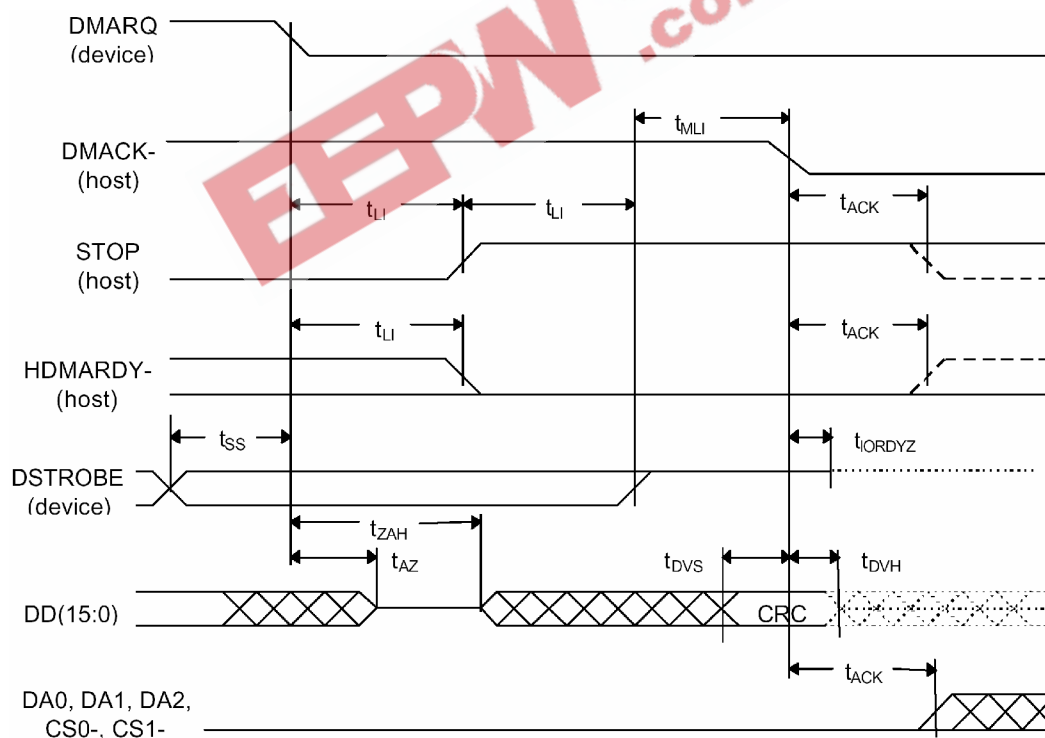

Notes:

1. The host may assert STOP to request termination of the Ultra DMA burst no sooner than  $t_{RP}$  after HDMARDY\_ is negated.
2. If the  $t_{SR}$  timing is not satisfied, the host may receive zero, one, or two more data words from the device.

Notes:

The definitions for the DIOW\_:STOP, DIOR\_:HDMARDY\_:HSTROBE and IORDY\_:DDMARDY\_:DSTROBE signal lines are no longer in effect after DMARQ and DMACK are negated.

## CHAPTER 7 PACKAGE DIMENSION

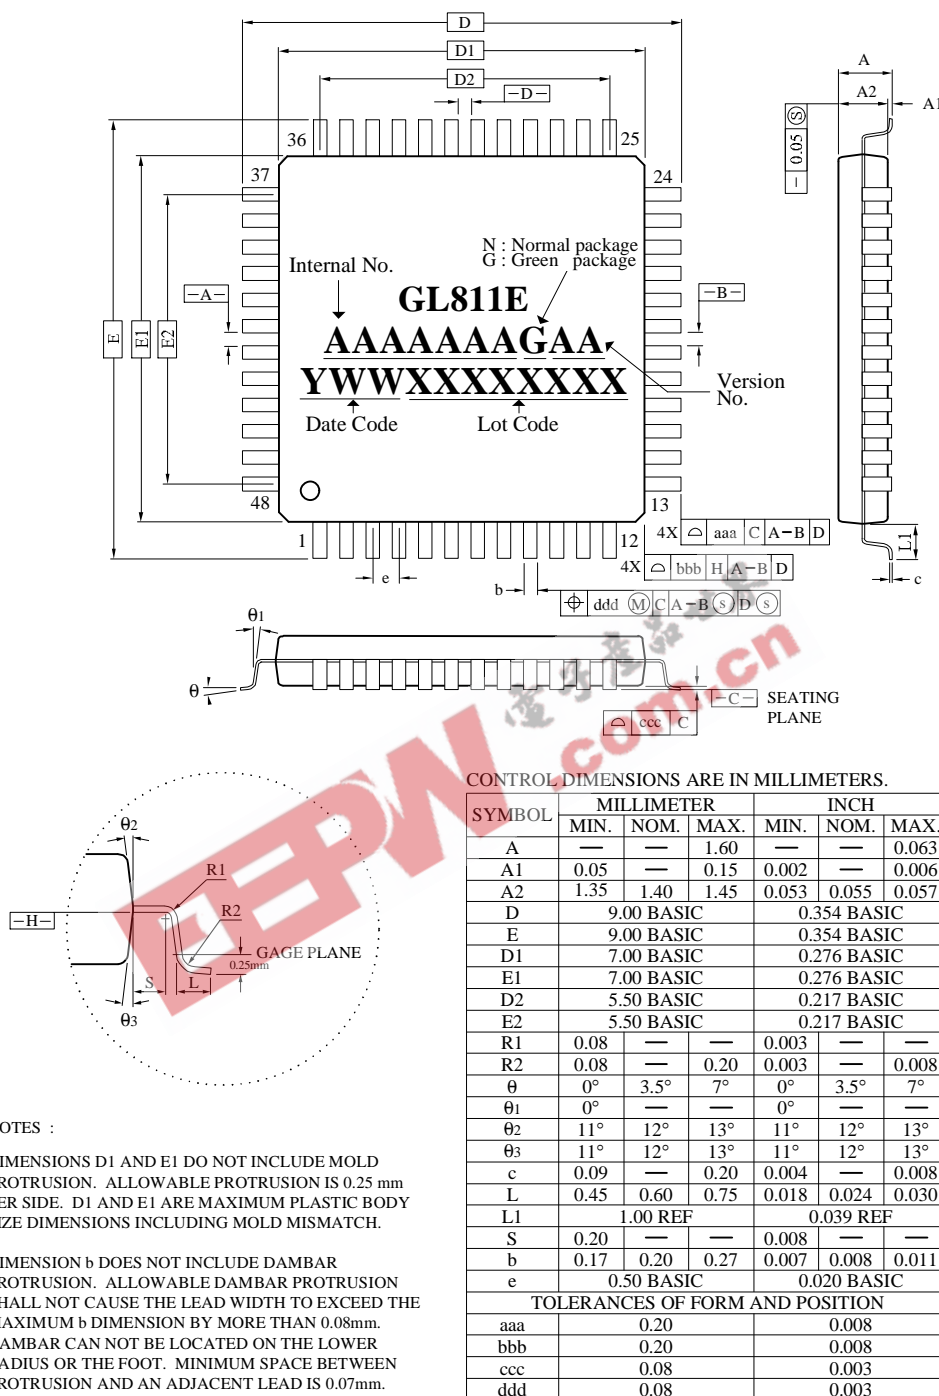

Figure 7.1 - GL811E 48 Pin LQFP Package

## NOTES :

1. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. D1 AND E1 ARE MAXIMUM PLASTIC BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH.
2. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM b DIMENSION BY MORE THAN 0.08mm. DAMBAR CAN NOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND AN ADJACENT LEAD IS 0.07mm.
